

## *Check the following...*

- ***Do not*** turn the furnace switch off and back on. Most furnaces have a built-in fault code, turning the switch off and on will reboot the control board and dismiss the fault code, this can make it harder to diagnose.
- Is the air filter clean?
- Is the switch turned on to the furnace?
- Is the circuit breaker turned on?
- Is the thermostat digital?
- Is there a “change battery” light or code flashing?
- Is the thermostat set to either heat or cool?
- Is the temperature turned up or down two degrees from the room temperature?
